## DATA ANALYSIS \& PROBABILITY

Statistics Review

# MEASURES OF CENTRALTENDENCY 

Objective: IWBAT use measures of central tendency to summarize data sets.

## Vocabulary:

- Measure of Central Tendency - (Mean, Median, Mode) - Used to organize and summarize a set of data
- Mean - (average) find the sum of the data values and divide by the number of data values in the set

$$
\text { mean }=\frac{\text { sum of data values }}{\text { total number of data values in set }}
$$

- Median - the middle value in an ordered set of data values; for a set with an even number of data, the median is the mean of the two middle values
- Mode - most frequently occurring value (or values) in a data set. Data set may have no mode, one mode, or more than one mode

## Vocabulary:

- Range of a data set - difference between the greatest and least data values.

## Example: Use the data set to find the mean, median, mode, and range of the data set.

| 58 | 62 | 66 | 70 | 76 | 78 | 81 | 84 | 77 | 73 | 68 | 63 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

1. Order the data.
2. Calculate the mean.
3. Identify the median.
4. Is there a mode? If yes, what is it? Is there more than one? If yes, what are the others?
5. Calculate the range.

## BOX-AND-WHISKER PLOTS

Objective: IWBAT make and interpret box-and-whisker plots, find quartiles and percentiles

## Vocabulary:

- Box-and-Whisker Plot - graph that summarizes a set of data by displaying it along a number line; it consists of 3 parts: a box, 2 whiskers
- Quartiles - values that divide a data set into 4 equal parts; $\mathrm{O}_{2}$ is the median of the data set, $O_{1}$ is the median of the lower half of the data, $O_{3}$ is the median of the upper half
- Interquartile Range - the difference between the third $\left(\mathrm{O}_{3}\right)$ and first ( $\mathrm{O}_{1}$ ) quartiles

- The LEFT Whisker extends from the minimum to Q1. It represents about $25 \%$ of the data.
- The BOX extends from $\mathrm{O}_{1}$ to $\mathrm{O}_{3}$ and has a vertical line through the median. The length of the box represents the interquartile range and contains about $50 \%$ of the data.
- The RIGHT Whisker extends from $\mathrm{O}_{3}$ to the maximum. It represents about $25 \%$ of the data.

For an odd number of data values, do not include the Median in either half when finding the $1^{\text {st }}$ and $3^{\text {rd }}$ Quartiles.

\section*{Example: Draw a box-and-whisker plot using the data provided below. <br> | 314 | 321 | 315 | 316 | 314 | 311 | 307 | 316 | 312 | 314 | 303 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |}

1. Order the data.
2. What is the minimum? Maximum?
3. Identify the median $\left(\mathrm{O}_{2}\right)$.
4. Find $\mathrm{O}_{1}$, the median of the lower half of the data.
5. Find $\mathrm{O}_{3}$, the median of the upper half of the data.
6. Find $\mathrm{O}_{1}, \mathrm{Q}_{2}, \mathrm{O}_{3}$, the minimum, and the maximum on the number line.
7. Draw the box. Extend the whiskers to the minimum and to the maximum.

## PROBABILITY

Objective: IWBAT find theoretical and experimental probabilities; find probabilities of mutually exclusive and overlapping events; find probabilities of independent and dependent events

## Vocabulary:

- Outcome - result of a single trial (example: spinning a wheel)
- Sample Space - all possible outcomes
- Event - any outcome or group of outcomes

| Event | Sample Space | Favorable Outcomes |
| :---: | :---: | :---: |
| $\downarrow$ | $\downarrow$ |  |
| Rolling an Even \# | $1,2,3,4,5,6$ | $2,4,6$ |

## Vocabulary:

- Probability of an event, or P(event), tells how likely it is that an event will occur.
>Probability can be written as a fraction, decimal, or percent $>$ Probability of an event ranges from o to 1 .

|  | less often than not | Probabili | more often than not |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | $\longrightarrow$ |
|  | 1 |  | 1 |  |
| 0 | 1 | 1 | 3 | 1 |
| 0 | 4 | $\frac{2}{2}$ | $\frac{\square}{4}$ |  |
| 0.0 | 0.25 | 0.5 | 0.75 | 10 |
| 0\% | 25\% | 50\% | 75\% | 100\% |
| impossible | unlikely | equally likely | likely | certain |

## Vocabulary:

- Theoretical Probability - when all possible outcomes are equally likely to occur

$$
\mathrm{P}(\text { event })=\frac{\text { number of favorable outcomes }}{\text { number of possible outcomes }}
$$

## Vocabulary:

- Odds - describe the likelihood of an event as a ratio comparing the number of favorable and unfavorable outcomes

$$
\text { odds in favor }=\frac{\text { number of favorable outcomes }}{\text { number of unfavorable outcomes }}
$$

odds against $=\frac{\text { number of unfavorable outcomes }}{\text { number of favorable outcomes }}$

## Vocabulary:

- Compound Event - consists of two or more events linked by the word "and" or "or"
- Mutually Exclusive - two events that have no outcomes in common; $P(A$ and $B)=0$.
- Overlapping Events - events that have at least one outcome in common

Probability of Mutually Exclusive Events:

$$
\mathrm{P}(\mathrm{~A} \text { or } \mathrm{B})=\mathrm{P}(\mathrm{~A})+\mathrm{P}(\mathrm{~B})
$$

Probability of Overlapping Events:

$$
\mathrm{P}(\mathrm{~A} \text { or } \mathrm{B})=\mathrm{P}(\mathrm{~A})+\mathrm{P}(\mathrm{~B})-\mathrm{P}(\mathrm{~A} \text { and } \mathrm{B})
$$

## Vocabulary:

- Independent Events - the occurrence of one event does not affect the probability of the second event

Probability of Two Independent Events:

$$
\mathrm{P}(\mathrm{~A} \text { and } \mathrm{B})=\mathrm{P}(\mathrm{~A}) \bullet \mathrm{P}(\mathrm{~B})
$$

- Dependent Events - the occurrence of one event affects the probability of the second event

Probability of Two Dependent Events:

$$
\mathrm{P}(\mathrm{~A} \text { then } \mathrm{B})=\mathrm{P}(\mathrm{~A}) \bullet \mathrm{P}(\mathrm{~B} \text { after } \mathrm{A})
$$
